Error Log Prime Number V2

```
ne given number is prime or not.

um + (isPrime   " is a prime number." : " is
```

**A problem that I encountered was during the addition of adding my variable for the prime number. What I was supposed to do was add a '?' . By adding this function, it separates the condition of the variable from the rest of the expressions.**

```
//Tells the user if the given number is prime or not.
    System.out.println(num + (isPrime ? " is a prime number." : " is not a prime number."));
    System.out.println("Thank you!");
```

This is the correct way.
